No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               YGAPOP=10 -YGAPEXT=0.5 -DELOP=6 -DELEXT=7
  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Xgapop 10.0 , Xgapext

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A DNA construct (AAT36360) codes for Bacillus stearothermophilus (Bst) DN1 polymerase large iragment (AAW10597) which lacks the N-terminal 3'-5' exonuclease domain of the native enzyme. It comprises nucleotides 868-2631 of the full-length Bst polymerase coding sequence, and was obto by PCR cloning (see also AAT60826-27) using Bst genomic DNA as template. The DNA construct can be used to produce recombinant Bst polymerase large fragment, pref. as a fusion protein with maltose binding protein, in Lransformed host cells. The product can be used for nucleic acid sequencing and strand displacement amplification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DNA encoding recombinant thermophilic Bacillus stearothermophilus DNA polymerase I - substantially free of 3'-5', and opt. also 5'-3' exonuclease activity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This is the nucleotide sequence of the clone Bst2 encoding a modified Bacillus stearothermophilus thermostable DNA polymerase which lacks the complete 5'-3' exonuclease domain. The gene was constructed by ligating the HindIII-SalI fragment from the clone pdemBst2.1Sst contg. 3' end of the gene with the Sty1-HindIII fragment of the clone pdemBst5'end contg. the 5' end of the DNA polymerase gene. The Sty1-HindIII fragment covers the mid-region of the gene up to and including the sequences encoding the 3'-5' exonuclease but not the 5'-3' exonuclease domain. The remainder of the 5' end of the gene was reconstituted by the ligated and extended oligonucleotides AATO4816-17. The modified DNA polymerase can be used in primer extension reactions such as DNA sequencing or polymerase chain reaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1294 CTGGCGCAAAACTTGAACATTACGCGCAAAGAA 1326

This heat stable DNA polymerase has a peptide sequence of 587 amino acids. This DNA polymerase can be used in a method for the replication of a DNA chain. It can also be used in a method for the determination of the sequence of DNA chain. As the DNA polymerase has a proof reading 3'-5' exonuclease activity, possible mismatches of base pairing that occurs in current methods of DNA sequence determination of

The modified DNA polymerase, has proofreading 3'-5' exounclease activity during DNA sequencing from a template and the polymerase excises mismatched nucleotides from the 3' torminus at a faster rate than it removes correctly matched nucleotides. The polymerase is used particularly for DNA sequencing, also for filling in
                                                                                                                                                                                                                                                                                                                                    New DNA polymerase, useful all four dideoxynucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      3' to 5' exonuclease activity;
```

The present sequence encodes a wild type Bacillus Stearothermophilus DNA polymerase (AAY91931) that is modified (see AAY91930) so that during DNA sequencing, it effectively incorporates all four fluorescent dye-labeled dideoxynucleotide triphosphates (ddNTP), or their analogs, and reduces the discrimination, observed with the unmodified enzyme, for incorporation of labeled ddCTP and ddATP, is new. The modified DNA polymerase, has proofreading 3'-5' exonuclease activity during DNA

Example 2; Page 80-82; 109pp; English.

The invention relates to reverse transcription of RNA templates using thermostable DNA polymerase such as Thermoactinomyces vulgaris (Tvu) and Bacillus stearothermophilus (Bst) DNA polymerase. Tvu and Bst DNA polymerase are useful for reverse transcription reactions which allows repetitive heating/cooling cycles without the requirement of fresh enzyme at each cooling step. The invention contemplates single-reaction RT-PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1294 TTGGCGCAAAACTTGAACATTACGCGCAAAGAA 1326

Primers, template, nucleoside triphosphates, appropriate reaction buffer having magnesium ions, reaction conditions, and polymerase are used in the PCR process, which involves denaturation of target DNA, hybridisation of primers and synthesis of complementary strands. The present DNA sequence is Bacillus stearothermophilus (Bst) DNA polymerase 1 fragment which lacks 5' to 3' exonuclease activity.
                          digestion and recombination of the full length gene (AAT04801) to remove a 195 bp Hincil-evull fragment from the region encoding the 5'-3' exonuclease. The deleted fragment removes 65 amino acids (residucs 178-242 of the protein) including 2 Gly residues though to correspond to 2 amino acids in the E.coli DNA polymerase I necessary for 5'-3' exonuclease activity. The modified DNA polymerase can be used in primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1294 TTGGCGCAAAACTTGAACATTACGCGCAAAGAA 1326

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Alignment Scores:
            thermostable DNA polymerase such as Thermoactinomyces vulgaris (Tvu) and Bacillus stearothermophilus (Bst) DNA polymerase. Tvu and Bst DNA polymerase are useful for reverse transcription reactions which allows repetitive heating/cooling cycles without the requirement of fresh enzyme at each cooling step. The invention contemplates single-reaction RT-PCR wherein reverse transcription and amplification are performed in a single continuous procedure. Primers, template, nucleoside triphosphates, appropriate reaction buffer having magnesium ions, reaction conditions, and polymerase are used in the PCR process, which involves denaturation
                                                                                                                                                                                                                                                                                          Reverse transcription of RNA using Tvu and Bst DNA polymerase, comprises combining the polymerase, RNA containing sample, a primer reaction buffer having magnesium ions and reacting the mixture to

The present sequence is Thermoactinomyces vulgaris (Tvu) DNA polymerase 7289M truncated mutant DNA. This Tvu T889M mutant DNA is obtained by deleting 864 bases from the 5' end of wild-type Tvu DNA polymerase gene and replacing 'C' at position 866 with 'T' in the wild
Novel thermostable DNA polymerase derived from Thermoactinomyces vulgaris for us in many recombinant DNA techniques, including amplification, reverse transcription and sequencing reactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Thermostable; DNA polymerase; hyperthermophilic; DNA synthesis;
Tvu DNA polymerase; nucleic acid amplification; reverse transcription;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Alignment Scores:
This DNA sequence of the Bacillus stearothermophilus strain encodes a heat stable DNA polymerase. This DNA polymerase has a peptide sequence of 589 amino acids. This DNA polymerase can be used in a method for the replication of a DNA chain. It can also be used in a method for the determination of the sequence of DNA chain. As the DNA polymerase has a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Local
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             absence of manganese ions and in high throughput robotically-manipulated procedures because greater enzymatic stability is retained at room temperature. Using the Tvu DNA polymerase, reverse transcription reactions can be conducted at increased temperatures so that secondary structure is removed or limited. The present sequence represents the nucleotide sequence encoding a 5′-3′ exonuclease deletion mutant form of Tvu DNA polymerase called T289M.

                              This is the nucleotide sequence of the clone Bst4 encoding a modified Bacillus Stearothermophilus thermostable DNA polymerase. This clone encodes the sequence of a natural degradation product obtained when the DNA polymerase clone Bst3 (AAT04803) is expressed in E.coli. The same sequence is found when the full length clone (AAT04801) is expressed and cleaved with subtlisin to produce a "Klenow-type" DNA polymerase. This sequence starts with the Val residue at pos. 287 of the full length protein. This contrasts with a commercially available B stearothermophilus DNA polymerase subtlisin fragment where the protein sequence starts with the Ala residue corresp. to pos. 290. The modified DNA polymerase can be used in primer extension reactions such a NA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1300 TTGGCGCAAAACTTGAACATTACGCGCAAAGAA 1332

                                                          A gene coding for DNA polymerase I was isolated from B.caldotenax YT-G genomic DNA (see AAQ31650). A series of N-terminal deletions was prepared to eliminate the region responsible for 5' to 3' exonuclease activity. Plasmid pUI205 was one of the deletion plasmids which still expressed PolI activity but for which no 5' to 3' exonuclease activity was detected. The insert contained in pUI205 is identical to nucleotides 1900 to 2868 of AAQ31650. E.coli HB101 transformed with pUI205 produced a heat-resistant DNA polymerase of mol. wt. 67,000 by SDS-PAGE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1303 CTGGCGCAAAACTTGAACATTACGCGCAAAGAA 1335

The invention relates to reverse transcription of RNA templates using thermostable DNA polymerase such as Thermoactinomyces vulgaris (Tvu) and Each DNA polymerase. Tvu and Est DNA CC polymerase are useful for reverse transcription reactions which allows CC repetitive healing/cooling cycles without the requirement of fresh enzyme at each cooling step. The invention contemplates single-reaction RT-PCR CC wherein reverse transcription and amplification are performed in a single CC continuous procedure. Primers, template, nucleoside triphosphates, CC appropriate reaction buffer having magnesium ions, reaction conditions, CC and polymerase are used in the PCR process, which involves denaturation CC of target DNA, hybridisation of primers and synthesis of complementary CC strands. The present sequence is Thermoactinomyces vulgaris (Tvu) DNA CC polymerase M285 truncated mutant DNA. This Tvu M285 mutant DNA is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁

                                                                                      having DNA synthesis activity. It is useful for determining the nucleotide base sequence of a DNA molecule. Two DNA polymerase can be used for processes of high temperature nucleic acid amplification and sequencing without substantial loss of DNA synthesis activity. The enzyme can be used to perform high temperature reverse transcription in the absence of manganese ions and in high throughput robotically manipulated
                               procedures because greater enzymatic stability is retained at room temperature. Using the Tvu DNA polymerase, reverse transcription reactions can be conducted at increased temperatures so that secondary structure is removed or limited. The present sequence represents the
                                                                                                                                                                             The invention provides compositions comprising thermostable DNA polymerases derived from hyperthermophilic eubacteria, in particular, polymerases a purified and isolated Thermoactinomyces vulgaris (Yvu) DNA polymerase
   nucleotide sequence encoding a 5'-3' Tvu DNA polymerase called M285.
                                                                                                                                                                                                                                                                                      Novel thermostable DNA polymerase derived from Thermoactinomyces vulgaris for us in many recombinant DNA techniques, including

                                                    This is the sequence of the coding region of the gene encoding the Bacillus stearothermophilus thermostable DNA polymerase. The gene was isolated using the PCR primers and probes AAT04807-15 which were based on sequence similarity with the Bacillus caldotenax DNA polymerase gene. The gene was isolated as two overlapping fragments of 885 and 1143 bp corresp. to the 3' end and the 3'-5' exonuclease region of the protein, resp. Those amplification fragments were used to probe Southern gels and isolate the 3' and 5' ends of the gene as two separate fragments. The complete gene (AAT04801) was subsequently polymerase can be used in primer extension reactions such as DNA sequencing or polymerase chain reaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bacillus stearothermophilus; thermostable DNA polymerase; PCR; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   B.stearothermophilus DNA polymerase coding sequence.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                               Score
